Stomach

- Crohn's Disease
- Ulcerative Colitis

The stomach's main function is digestion (breaking down food, which occurs through muscle contractions and the secretion of acid and digestive enzymes).

- It is rare for Crohn's disease to affect the stomach.
- ● Gastritis (inflammation of the stomach) can occur for several reasons, including as a result of medication (i.e. steroids, ibuprofen, oral iron)

“As a Professional Member of the Crohn’s & Colitis Foundation, I have had the pleasure of serving on the National Scientific Advisory Committee, developing patient education resources such as the GI Tract Guide. I’ve collaborated with wonderful providers from all over the country, learning from their collective experiences taking care of patients.”
